

PopApp Buyer App — Dev QA

Customer-perspective pass over the `eventtest01` store on the local dev build, focused on the new payment flow and abandonment edge cases.

TARGET	ENVIRONMENT	DATE
localhost:9900 · eventtest01	Dev (HBuilderX H5)	6 August 2026
ORDER PLACED	NEW ISSUES	CONFIRMED KNOWN
#274073	7	3 (FLPD-274)

The new payment flow is materially safer than what is live in production.

Orders now sit at *Awaiting Payment* until payment actually clears, and the confirmation page cannot be reached by URL to obtain tickets — it correctly answers “Payment is required / Tickets Unavailable”. That closes the most serious defect found on the production store, where clicking “Complete” self-certified payment and issued a valid pass.

The blocking defect here is checkout, not payment.

Order Note is enforced as required but labelled “(optional)”, and pressing Place Order with it empty does nothing at all — no toast, no inline error, no network request. Worse, if a customer leaves checkout and comes back, the Order Note is silently cleared while every other field is restored, so the form looks complete and Place Order dead-ends. Those two defects compound into a checkout a customer cannot get through and cannot diagnose.

Summary

#	SEVERITY	ISSUE	STATUS
1	HIGH	Place Order fails silently when the required Order Note is empty	New

#	SEVERITY	ISSUE	STATUS
2	HIGH	Order Note is cleared on return to checkout while all other fields persist	New
3	MEDIUM	Unpaid orders consume event inventory	New
4	MEDIUM	"Pay" proceeds to the card page with no card selected	New
5	MEDIUM	Card form takes ~15 s to appear with no loading indicator	New
6	MEDIUM	Tickets "Valid" filter lists Pending Payment tickets	New
7	LOW	Malformed payment URL: <code>null</code> literals, duplicate param, nested query string	New
—	KNOWN	Order Note expanded by default	FLPD-274 #1
—	KNOWN	Attendee fields auto-filled from history	FLPD-274 #4
—	KNOWN	Back arrow on interstitial pages	FLPD-274 #9 — appears fixed

New findings

HIGH 1. Place Order fails silently on an empty Order Note

The Order Note card is labelled `Order Note *` with the subtitle "Required by the merchant", while the field's own placeholder reads "Leave a message for the merchant (*optional*)". The card contradicts itself.

With the note left empty, pressing Place Order does nothing observable: no toast, no inline error, no field highlight, and — confirmed with the network log cleared immediately beforehand — **zero network requests**. The console records no validation message either. Filling the note lets the order through immediately, which confirms the note is the blocker.

A customer has no way to discover what is wrong. The button simply appears broken.

Reproduce: pick an event → select a package → Reserve Tickets → leave Order Note empty → Place Order.

Checkout

Order Note

Add a note for the merchant.

Order Note *

Required by the merchant.

Leave a message for the merchant (optional)

Place Order

After Place Order: unchanged, no message, no request issued.

HIGH 2. Order Note is silently discarded on return

Filling checkout part-way, navigating to the home page, then returning restores the attendee name and email exactly as typed — but the Order Note comes back empty, with no indication anything was dropped.

Because the note is the one genuinely required field, and because it is also the field whose absence fails silently (issue 1), the two defects compound: the customer returns to a form that looks complete, presses Place Order, and nothing happens with no explanation.

Reproduce: fill name and Order Note → navigate to home → navigate back → the note is blank, the name is not.

Back on checkout: Order Note blank, identity fields retained.

MEDIUM 3. Unpaid orders consume inventory

The package showed "12 shared spots left" before ordering. After placing order #274073 — which remains at *Awaiting Payment* and was never paid — it showed "11 shared spots left".

Seats are therefore held by orders that may never be paid, with no visible release. The same behaviour was observed on the production store, so this is not specific to the new flow.

Reproduce: note "spots left", place an order, choose not to pay, reload the event page.

MEDIUM 4. "Pay" proceeds with no card selected

The payment sheet offers "+ Pay With A New Card" and a "Pay \$10.40" button. Pressing Pay *without* choosing or adding a card navigates onward to the card page anyway, with no prompt to select a payment method first.

Worth separating from Finix's own behaviour: once the card form itself renders, its Pay button is correctly **disabled** until the fields are valid. The gap is in the Unico sheet that precedes it.

"Pay \$10.40" is live with no card selected.

MEDIUM 5. Card form takes ~15 s with no loading state

After continuing to card payment, the page renders only a "UniCo" logo and a "Billing address is the same as shipping address" checkbox for roughly fifteen seconds before the card fields appear. There is no spinner, skeleton, or message during the wait.

On a payment screen this reads as a broken page, and invites the customer to reload or press back mid-transaction.

Two smaller points on the same form: the "Billing address is the same as shipping address" box is ticked, yet the full address block is still shown and empty — and for an event ticket there is no shipping address for it to refer to.

The form after it finally renders. For ~15 s beforehand only the checkbox is visible.

MEDIUM 6. "Valid" ticket filter lists Pending Payment tickets

The Tickets page Valid tab returns two tickets, both badged *Pending Payment*. The filter is not excluding unpaid tickets. Identical behaviour was found on the production store.

Separately, ticket #4898 renders its event name, date and venue as -- with a blank thumbnail, so the row carries no usable information.

Under "VALID": two Pending Payment tickets, one with all fields as --.

LOW 7. Malformed payment URL

The card page is reached at a URL containing several defects:

- `phone=null&finixId=null` — the string "null" passed as a value rather than the parameter being omitted
- `orderType=6&orderType=6` — the same parameter twice
- `redirectPath=/pages/order/activity-confirm?orderId=274073` — an unencoded nested query string, so the second ? makes the tail ambiguous to any standard parser

None of these broke the flow in testing, but they are fragile and they publish the post-payment redirect target in the address bar.

What worked well

- **GOOD Payment state is server-authoritative.** Navigating directly to `#/pages/order/activity-confirm?orderId=274073` — the redirect target the URL itself discloses — correctly returns “AWAITING PAYMENT / Payment is required”, with the tickets button disabled and reading “Tickets Unavailable”. No pass is issued. This is the defect that *is* exploitable on the production store, and it is closed here.
- **GOOD Unpaid orders stay honest.** Order #274073 remained at Awaiting Payment throughout, and no ticket was issued against it.
- **GOOD Finix guards its own form.** The card form’s Pay button is disabled until the fields validate.
- **GOOD Interstitial pages now have a back arrow** (FLPD-274 #9 appears addressed on the Complete Payment and Order Confirmation screens).
- **GOOD The checkout redesign is a clear improvement** — numbered ticket-holder cards with a “Complete” badge, an explicit fee line, and a persistent “Total due today” footer.

The confirmation URL reached directly, correctly refusing to release tickets.

Already tracked — confirmed still present

These reproduce but are already covered by **FLPD-274** and are recorded here only as confirmation, not as new reports.

- **FLPD-274 #1** Order Note is expanded by default rather than collapsed until tapped.
- **FLPD-274 #4** Attendee name and email arrive pre-filled from a previous order without the customer entering them.
- **FLPD-274 #9** Back arrows on interstitial pages — present on the screens seen in this pass, so this one looks resolved.

Also still present, unchanged from the earlier dev pass: `TypeError: service.request is not a function` at `cool/bootstrap/eps.ts:85` on every page load, and the browser tab title rendering as the literal string `name`.

Suggested priority

1. **Make Place Order explain itself.** An empty required Order Note must produce a visible error on the field. A primary action that does nothing is the single worst outcome in a checkout.
2. **Decide whether Order Note is required, then say so consistently** — the label, the subtitle and the placeholder currently disagree.
3. **Persist the Order Note** alongside the other fields, or clear all of them together so the form's state is honest.
4. **Release inventory** held by unpaid orders, or hold it on a visible timer.
5. **Add a loading state to the card page** and require a payment method before leaving the payment sheet.
6. **Fix the Valid ticket filter**, and the `--` placeholder rendering on ticket #4898.
7. Tidy the payment URL: drop `null` literals, de-duplicate `orderType`, and encode `redirectPath`.

Scope. Tested as an anonymous guest against the local dev build (HBuilderX H5 on `localhost:9900`) at `#!/?domain=eventtest01`, on 6 August 2026 at desktop width. One order was placed — **#274073**, \$10.40, Online Payment — and deliberately left unpaid at Awaiting Payment.

Not covered: the card transaction itself. No card number was entered, so the post-payment behaviour — including whether the order status refreshes correctly once payment clears (**FLPD-274 #3**) — was not exercised and remains unverified in this pass. Also not covered: coupon redemption, points redemption, membership purchase, refunds and cancellations, merchant-side check-in, and non-H5 targets.

Note on ports. Starting the dev server brings HBuilderX up on `127.0.0.1:8888` for livereload, alongside the 总后台 already bound to `:::8888`. The admin remains reachable on `localhost:8888` and `:::1:8888`; only the literal `127.0.0.1:8888` is shadowed. Ports 3000 and 3030 were untouched.
